Problem Statement

The task is to create an AI-based application in the medical field that identifies plants from photos and provides information on their toxicity and medical uses. The solution involves building an AI model that accepts a photo of a plant and outputs the plant's name, its toxicity status, and its medical uses.

Solution we give

We are building an AI model that will take a photo of a plant and give the user its name, tell them if it is poisonous, and provide information on its medical uses.

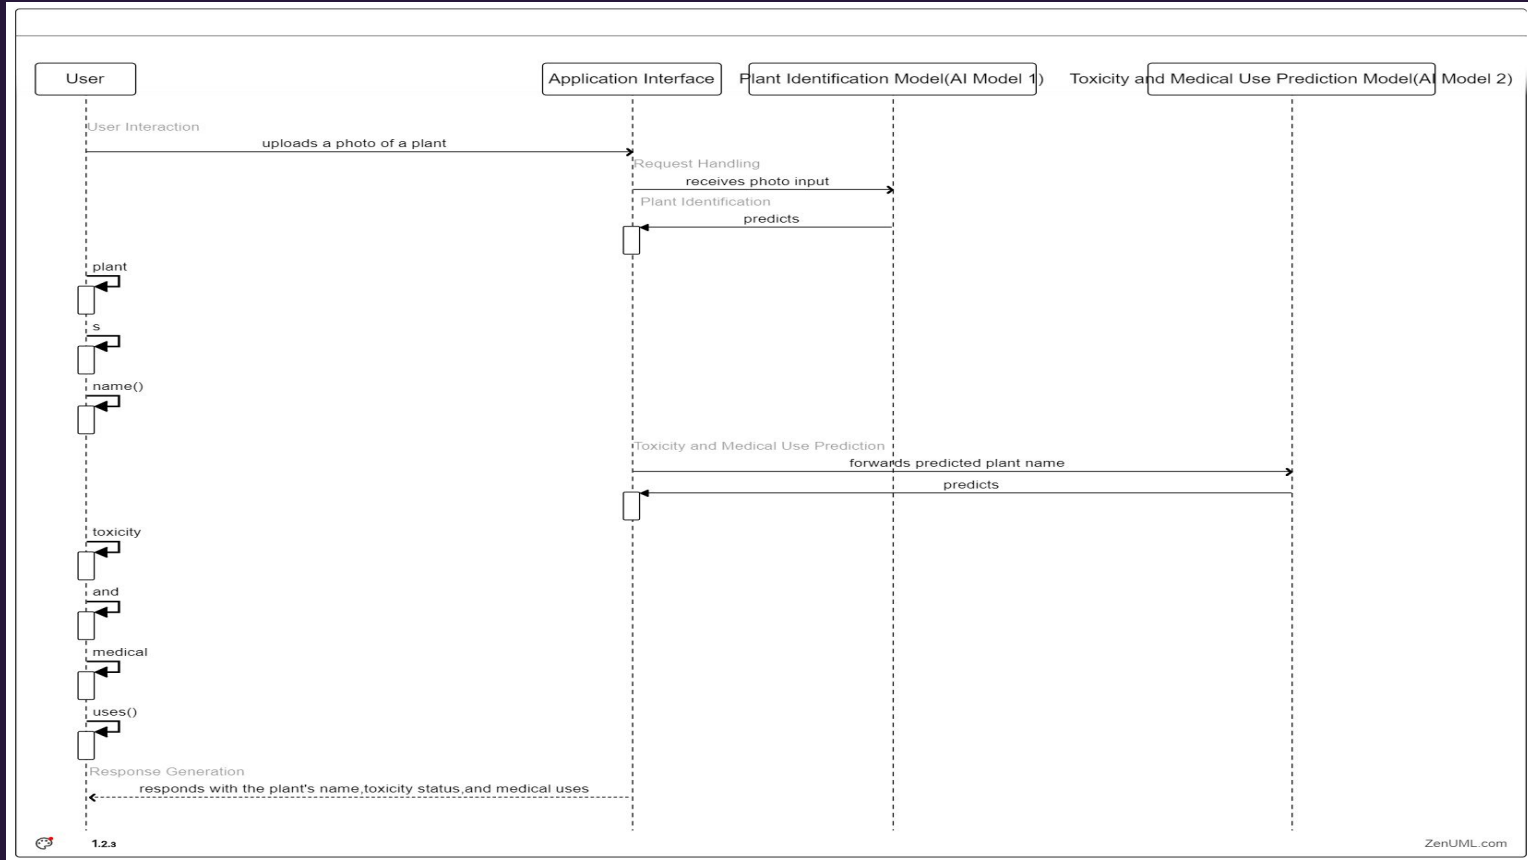

1. **User Interaction:** The user interacts with the provided interface and inputs a photo of the plant.
2. **Request Handling:** The application accepts the user's request (photo input).
3. **AI Model Processing:**
 - **Plant Identification:** One AI model predicts the name of the plant from the photo.
 - **Toxicity and Medical Uses:** Another AI model takes the predicted plant name as input and predicts whether the plant is toxic and provides its medical uses.
4. **Response Generation:** The application responds with the name of the plant, its toxicity status, and its medical uses.

Ai/ml model use

- Image prediction used
- Toxicity prediction
- Medical use prediction
